The MicroCross DVI I/O Connectors from Molex are leading the way in support of the DDWG (Digital Display Working Group) DVI interface standard. MicroCross DVI has been chosen by the DDWG as the standard digital interface for connecting a host device and display device to support high-resolution video applications. Supporting one or two digital channels driven by TMDS (Transition Minimized Differential Signaling) and/or a high bandwidth analog interface, the MicroCross was chosen by the DDWG for its size, performance and cost. No other interface in the industry compares. The innovative crossing ground blade design and LFH™ (Low Force Helix) contact interface design provides the industry with a video interface design that will support over 1.65Gb/s per differential pair (for a total 9.9Gb/s over a dual link implementation) and 2.5GHz support for the analog interface. This provides the industry the performance head room it needs for future growth and development of video products.This innovative approach addresses the problem of an industry in transition. By providing a single high performance interface, precious board I/O space is saved and lower system costs are achieved. The interface provides added benefits of a high cycle life interface for mobile applications and the improved EMI performance needed for high speed links. The EMI performance is achieved through the 360° shielding of the MicroCross DVI cable and connector design. The MicroCross DVI connector system and the DVI standard are moving the graphics industry to the next level by providing unmatched electrical and mechanical performance while allowing for low cost implementation.

How do I order an A26508 header with 16 pins?

Call Digi-Key where you'll happily receive the price,
or
Determine the cost yourself.

A □□-□□□-□□-ND

Base Part Number — Number of Desired Pins per Row

Step 1. Select needed Digi-Key Part Number and number of pins desired.

Step 2. Begin with the appropriate "Base Price" of your selected part number (refer to chart).

Step 3. Multiply the number of pins you desire by the "Pin Adder" of your selected part number (refer to chart).

Step 4. Add Step 2 and Step 3 together for final cost!

Our Example:

Step 1. A26508-16-ND
Step 2. .56
Step 3. 16 x .02 = .32
Step 4. Your Cost = $.88

SCSI Terminators

SCSI TYPES:

Single-Ended: Allows up to 5 megabytes per second **A. Passive:** 220/330Ω; for lower data transmission rates • Termination of each signal consists of 220Ω to Term Power Line and 330Ω to ground • 36 resistors • Ideal impedance match, 132Ω **B. Active:** Also referred to as "Regulated" or "Boulay." These terminators include a voltage regulator along with resistors and capacitors. They support applications requiring longer cable lengths and faster data transmission rates. • Eighteen 110Ω resistors • Three or more capacitors • Two voltage reference resistors • One voltage regulator

Differential: Allows up to 10 megabytes per second, cable lengths up to 25 meters • Requires more powerful drivers than single-ended • Ideal impedance match, 122Ω

Force Perfect: Use with near non-SCSI applications wherein the larger bandwidth and faster risetimes create special problems; compensates for variances by averaging the impedance mismatches through diode switching and biasing techniques. Circuitry: Thick film resistors and/or discreet components on aluminum substrate or plastic laminate

Active Negation: Used by SCSI-2 and SCSI-3 Drivers and Receivers in single ended active applications to help ensure clean, noise-free transitions of the signals. These terminators can source as well as sink current, thereby maintaining voltage control.

Terminal Blocks

Micro-Pitch Terminal Blocks: The MPT 0.5 is the smallest screw terminal block available. With a micro-pitch of 2.54mm, the MPT 0.5 is ideal for high density applications.

Press Fit Terminal Blocks: The Press-Fit printed circuit board terminal block line is the perfect solution when wave soldering is not an option. The Press-Fit line is available in both fixed and pluggable styles.

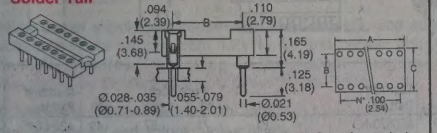
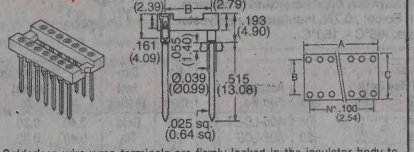
Dual-In-Line Sockets – Open Frame (Screw Machined)

Solder Tail



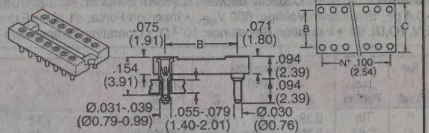
Most popular line of standard low profile IC-Sockets. Open frame design leaves space beneath IC for improved heat dissipation, easier PCB cleaning and inspection. **Insertion Characteristics:** 4-finger standard **Plating: For ED3308-ED3964:** Sleeve (Pin) – 200µ" Sn. Contact (Clip) – 30µ" Au. **For ED3108-ED3764:** Sleeve (Pin) – 200µ" Sn. Contact (Clip) – 150µ" Sn. **For ED56083-ED56646:** Sleeve (Pin) – 10µ" Au. Contact (Clip) – 30µ" Au.

Wire Wrap



Solderless wire wrap terminals are firmly locked in the insulator body to withstand torque of wrapping tool. Length of terminal for three-level wrapping. **Insertion Characteristics:** 4-finger standard **Plating: For ED4308-ED4964:** Sleeve (Pin) – 200µ" Sn. Contact (Clip) – 30µ" Au. **For ED57083-ED57406:** Sleeve (Pin) — 10µ" Au. Contact (Clip) — 30µ" Au

Low Profile



"Ultra low profile" Dual-in-line sockets are equipped with specially designed contacts allowing .095" (2.41mm) height above PCB. Special short contact requires .075" (1.91mm) insertion depth only. Solder tail diameter .030" (.76mm). **Insertion Characteristics:** 4-finger short contact **Plating:** Sleeve (Pin) — 200µ" Sn. Contact (Clip) — 30µ" Au.

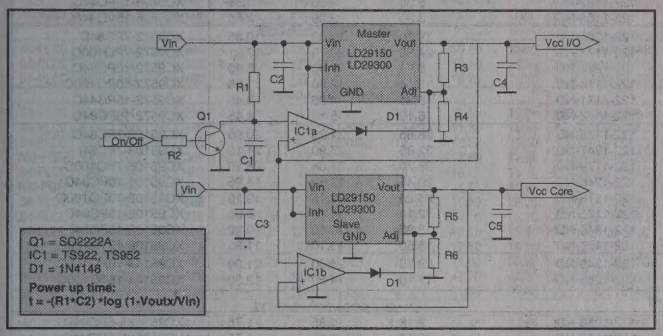
Xilinx FPGA Power Management Systems

Xilinx power supply requirements for the core, I/O, and auxiliary power supplies include voltage outputs ranging from 1.2V to 5V and current outputs from tens of milliamps to multiple amperes. Depending on the system requirements, a linear or a switching regulator may be used to supply power to the FPGA.

STMicroelectronics makes both linear and switching regulators with a wide variety of output voltages and output current levels.
When power sequencing is needed, the following circuit will control the power-up and power-down sequence of the Vcc_{core} and the V_{cco} supply voltages.

Linear regulators are the best choice when board space is at a premium, low output noise is important or a fast response to inputs and transients is required. Linear regulators provide low to medium output currents (up to 3A) with a simple design approach.



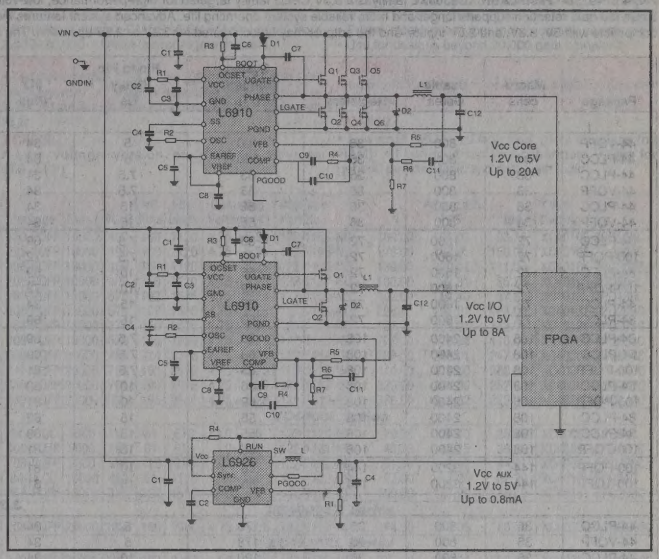
Linear Solution

The above solution implements a controlled slew rate on power up and power sequencing for the core and I/O voltages. Both outputs rise and fall with the same slew rate, set by R1 and C1. t=-(R1*C2) *Log (1 - Vccx/Vin)

Note: Vout Master must be higher than Vout Slave

Switching regulators are best used when design efficiency is critical and/or large output currents are required (such as Spartan-3™ and Virtex-II™). Switching supplies are known for excellent efficiency, but the output is more susceptible to noise due to the switching nature of the regulator.

Switching regulators require inductors and input and output capacitors for DC-DC conversion.



Switching Solution

The above solution provides a Core voltage range from 1.2V to 5V with a current up to 20A, an I/O voltage from 1.2V to 5V with a current capability up to 10A, and an auxiliary supply voltage from 1.2V to 5V up to 800mA.

★ The required I/O current will depend on several design specific factors, including I/O usage, loading, etc. Designers should use FPGA power estimator tools to determine the required Iccio current.

XILINX XC9500 In-System Programmable CPLDs (Complex Programmable Logic Devices)

The **XC9500 CPLD** family provides advanced in-system programming and test capabilities for high performance, general purpose logic integration. All devices are in-system programmable for a minimum of 10,000 program/erase cycles. Extensive IEEE 1149.1 (JTAG) boundary-scan support is also included on all family members. The XC9500 family is fully pin-compatible allowing easy design migration across multiple density options in a given package footprint. Advanced system features include output slew rate control and user programmable ground pins to help reduce system noise. I/Os may be configured for 3.3V or 5V operation. All outputs provide 24mA drive. The **FastFLASH XC9500XL** family is a 3.3V CPLD family targeted for high-performance, low-voltage applications. The XC9500XL architectural features address the requirements of in-system programmability. Extended data retention supports longer and more reliable system operating life. Advanced system features include output slew rate control and user-programmable ground pins to help reduce system noise. Each user pin is compatible with 5V, 3.3V, and 2.5V inputs, and the outputs may be configured for 3.3V or 2.5V operation. The XC9500XL device exhibits symmetric full 3.3V output voltage swing to allow balanced rise and fall times.

The **Virtex FPGA** family delivers high performance, high capacity programmable logic solutions. Dramatic increases in silicon efficiency results from optimizing new architecture for place and route efficiency and exploiting an aggressive 5 layer metal 0.22 µm CMOS process. These advances make Virtex FPGAs powerful and flexible alternatives to mask programmed gate arrays. System performance up to 200 MHz - 66 MHz PCI Compliant-Hot swappable for Compact PCI. The **Virtex-E family** is up to 30% faster than the Virtex family. System performance up to 240 MHz using singled ended SelectI/O+™ technology. Virtex-E devices have up to 640 Kb of faster (250 MHz) block SelectRAM+™, but the individual RAMs are the same size and structure as in the Virtex family. Both Virtex Families are supported by FPGA Foundation™ and Alliance Development Systems.
The **Spartan™-II 2.5V** Field -Programmable Gate Array family gives users high performance, abundant logic resources, and a rich feature set, all at an exceptionally low price. System performance is supported up to 200 MHz. The **Spartan™-II 1.8V** Field Programmable Gate Array is similar to the Spartan-II family but operates at a lower voltage.

XILINX Programmable Gate Arrays

FPGA (Field Programmable Gate Arrays)

A Technical Overview:

Every Xilinx FPGA performs the function of a custom LSI circuit, like a gate array, but the Xilinx device is user-programmable and even reprogrammable in the system.

Xilinx sells standard off-the-shelf devices in many different sizes, speeds, operating temperature ranges and packages.

The user selects the appropriate Xilinx device and then converts the design idea or schematic into a configuration data file, using the Xilinx development system software, and loads this file into the Xilinx FPGA.

ALTERA® CPLDs

Altera's Max families include the cost-optimized MAX 3000 and the high-performance MAX 7000 CPLD's, each of which offers densities, packages and speed grades to meet a variety of design needs. Altera's MAX CPLD's are non-volatile, single-chip solutions that do not require additional configuration devices. This means that they can be pre-programmed and reprogrammed using in-system programmability (ISP) and will retain the programming algorithm securely, even when the device is powered off.

Configuration Devices

During device operation, Altera® FPGA's store configuration data in SRAM cells. Because SRAM memory is volatile, the SRAM cells must be loaded with configuration data each time the device powers up. You can configure the devices using data stored in an Altera configuration device. Altera configuration devices are offered in different densities and provide a variety of features.

Single-Chip USB to UART Bridge

The CP210x is a single-chip USB to UART bridge that converts data traffic between USB and UART formats. The chip includes a complete USB 2.0 full-speed function controller, bridge control logic and a UART interface with transmit/receive buffers and modem handshake signals.

The device also features on-board EEPROM, a voltage regulator, a USB transceiver and an integrated internal oscillator, eliminating external components generally required in USB applications. System development is further simplified by the CP210xEK evaluation kit, which includes a complete USB to RS-232 evaluation board and royalty-free device drivers for PC and Macintosh platforms.

Microcontrollers and Other Programmable Devices

For the mass market ST offers several families of microcontrollers, e.g. the ST62, the ST7 and the ST9 ranges, with the result that there is a ST microcontroller to suit every kind of application, from those where minimum cost is the primary requirement to those that need powerful real-time performance and high-level language support. The recently introduced ST FIVE family integrates all the benefits of microcontrollers, together with a dedicated architecture, the "Decision Processor", oriented to high-level algorithms and a visual programming approach. ST also offers the innovative Programmable System Memory (FlashPSD, DSM) products, which combine memory functions such as Flash, EEPROM and SRAM with programmable logic on a single chip. Designed to interface with all standard microcontrollers to provide a complete system implementation, Programmable System Memories can be quickly and easily programmed without special manufacturing equipment, even in the field.

Low Cost Field Programmable Microcontroller Peripherals

The low cost PSD3XX family integrates high-performance and user-configurable blocks of EPROM, programmable logic and optional SRAM into one part. The PSD3XX products also provide a powerful microcontroller interface that eliminates the need for external "glue logic". The part's integration, small form factor, low power consumption and ease of use make it ideal for interfacing to virtually any microcontroller.

Major functional blocks of the PSD3XX: • Two programmable logic arrays • 256Kb to 1Mb of EPROM • Optional 16Kb SRAM • Input latches • Programmable I/O ports • Page logic • Programmable security

The ZPSD3XX has improved technology that helps reduce current consumption using the Turbo bit. Excellent if you require a 5V version of the PSD3XX that uses less power.

Speed: -70 = 70ns, -90 = 90ns

ST9 Emulator

The ST92F150-EMU2 Emulator is built around the ST92F150 device and can be used to emulate any of the ST92F124/ F150/F250 family of devices. When debugging the application, the emulator reproduces the behavior and functionality of the ST9 microcontroller (MCU) in real time while connected to the application board in place of the MCU. It provides access to the MCU's internal resources (such as registers and memories) and provides powerful debugging capabilities such as management of break points and applications code trace. The emulator is composed of three parts: • ST9 Visual Debug Integrated Development Environment (IDE), running on your host PC • The ST9 HDS2V2 main board, connected to the host via a parallel cable, containing all emulation resources and communicating with the PC via a master microcontroller • A probe specific to the microcontroller and its package that is connected to the main board casing via 3 flat cables. The probe contains the emulated ST9 microcontroller, which runs the application program using its internal peripherals. The probe is connected to the application board via the ST9 microcontroller's socket.

FEATURES: Hardware: • Clock source selectable • Application power up detection • 9 External input triggers • 2 Output triggers (TTL levels)

SPECIFICATIONS: Host PC System Requirements: • One of the following operating systems: Microsoft Windows® 95, 98, 2000 or NT • Intel Pentium (or compatible) processor with minimum speed of 133MHz • Minimum RAM of 32MB (64MB recommended) • 50MB of free hard disk space to install all of the ST9 tools

ST9 Programmer

The ST92F150-EPB/US is a programming board kit which allows programming of ST9F150x1, x9 and ST92F124x1, x9 microcontrollers having EEPROM and FLASH memories. In-Situ Programming (ISP) is available for the FLASH devices. It is designed for programming prototypes or small quantities of microcontrollers. For mass production, using the appropriate gang programmer is recommended. This programmer can operate in remote mode under control of a Windows® 95/98/NT/2000 computer using a standard PC parallel port. Object code in either Intel HEX or Motorola S19 format is read from the disk file to program the target device. The menu-driven software also offers VERIFY, BLANK CHECK, READ, ERASE master and other utility functions.

FEATURES: Software: A host PC running the ST9 is the control interface for the ST9 EPB. STVP9 is a graphical Windows® interface which allows the user to: • Read, view, edit and save executable files in the Intel HEX and Motorola S19 formats, generated by the Assembler, Linker or C Compiler for ST microcontrollers • Program executable files into ST microcontrollers • View and verify a microcontroller's memory contents • Either create a project that defines how to program the microcontroller(s) or load the files whose contents you want to program and then execute the program

Freescale Semiconductor's Single-Chip Ethernet Solution — MC9S12NE64

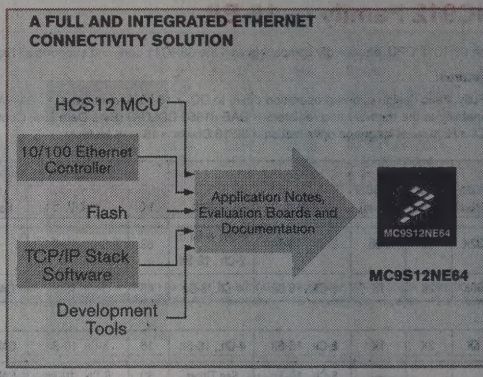
Thinking about standardizing your communications nodes?
MC9S12NE64 is a powerful Ethernet based solution.

Not a lot of ethernet experience?
MC9S12NE64 is designed to replace many proprietary communication nodes into the simple to maintain ethernet environment. Open source software, a robust development tool offering, and publicly available online Virtual Lab makes developing on the MC9S12NE64 a snap!

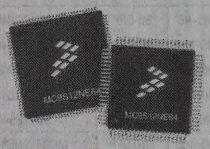
Ethernet isn't just for offices anymore!
MC9S12NE64 is cost effective, scalable, and flexible - ready for the next generation of design creativity.

Typical application areas:

- Networked appliances
- Security systems
- Industrial control
- Remote equipment
- Ethernet bridge
- Vending machines
- Home/office automation



MC9S12NE64 — One Chip Does it All



The MC9S12NE64 is based on the powerful HCS12 core, which integrates third generation Flash technology. Its rich offering of Ethernet connectivity features makes the MC9S12NE64 the odds-on favorite to replace noisy, multichip solutions with full-featured Ethernet connectivity.

- Object code compatible with the 8-bit 68HC11 and 68HC12 families
- Compact code optimized for C
- Up to 25 MHz bus rate (40 ns minimum instruction cycle)
- Flexible addressing modes for efficient pointer manipulation and looping control

Serial, real-time emulation is now standard operating procedure over a single debug pin. The on-chip module has a trace and trigger capability that was once the province of expensive emulators. But the advantages of on-chip debug doesn't stop there.

- Virtually no limitations on frequency or voltage like traditional emulators; real-time emulation of all MCU functions is possible at full operating voltage and frequency range.
- Four bus capture modes provide flexible data acquisition.
- Instead of cumbersome emulator cables, a single, dedicated pin provides non-intrusive debugging.
- The emulator's expensive bus analyzer is replaced by nine flexible triggers and buffer hardware.
- Internal registers and memory can be viewed and changed while running application code.
- Single-step, run or trace application code on the target processor.

32-Bit Microcontrollers

ColdFire™ the highly integrated ColdFire series of processors allow for advanced performance at low cost. Rich peripheral sets and development tools make these processors both easy to use and highly functional. The variable length RISC architecture enable this processor to save system memory and cost. **PowerPC** series of processors from Freescale Semiconductor, Inc. are the ideal foundation for RISC embedded applications. Features include high scalability and code compatibility over the entire line. **M-Core** with an emphasis on low power consumption, the M-CORE series of processors are the ideal match for handheld and other low-power applications, which require high performance. **68K** series of processors are ideal for the engineer looking for high performance at a reduced cost. The wide array of 68K processors can suit most any application.

STAMP uClinux Kernel Board Support Package for Analog Devices ADSP-BF533 Blackfin Processor

The STAMP uClinux Kernel Board Support Package (BSP) provides developers with a cost effective environment to develop embedded systems with the ADSP-BF533 Blackfin Processor.

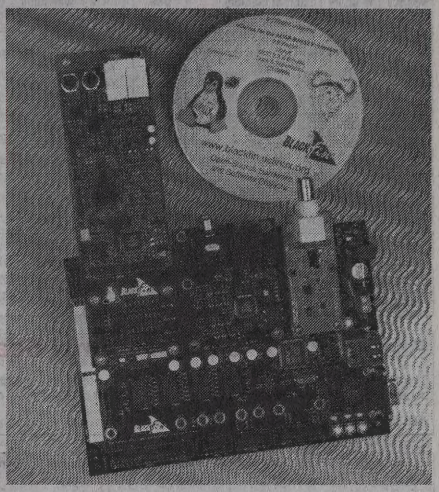
The BSP includes an ADSP-BF533 STAMP development board, a recent copy of the open source development tools and the uClinux Kernel. The STAMP board has been specifically designed to support the development and porting of open source uClinux applications and includes the full complement of memory along with serial and network interfaces.

The BSP also includes a CD with the open source development tools, documentation, board schematics, Gerbers, and layout files. There are a wide variety of daughter boards available to plug into this board that add interface functions such as audio, video and analog input or output.

For the most recent versions of tools and documentation, visit the uClinux for Blackfin Processor web site: http://blackfin.uclinux.org.

This web site is the central repository for all Blackfin Processor open source projects and hosts several projects based on the STAMP and daughter boards, such as a networked audio media node and a networked oscilloscope.

Part Number: ADDS-BF533-STAMP



BLACKfin®

The Blackfin Processor is Supported by Analog Devices Line of Robust and Flexible Development Tools

VisualDSP++®

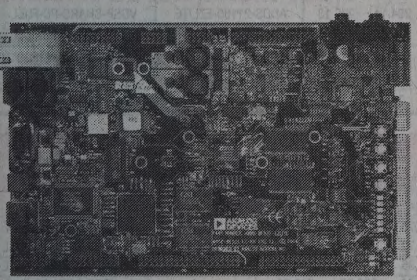
VisualDSP++ delivers efficient project management, enabling programmers to move easily between editing, building, and debugging within a single interface.

Key features include:

- Optimizing C/C++ compiler
- Advanced plotting tools
- Embedded OS support (VDK)
- Award-winning statistical profiling
- TCP/IP and USB support
- Free software upgrades
- Technical support

EZ-KIT Lite® Evaluation Platform

A cost-effective method for initial evaluation and for learning more about ADI hardware and software development and prototype applications.



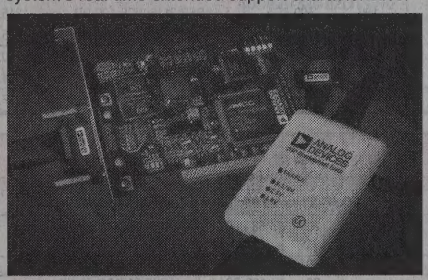
EZ-Extender™

A variety of Blackfin EZ-Extender daughter boards are available that allow developers to connect to a number of Analog Devices High Speed Converter (HSC) evaluation boards, camera evaluation boards, and external displays. Some of the EZ-Extenders contain a USB 2.0 interface and 10/100 Ethernet MAC and advanced audio and video circuitry.

Emulators

The High Performance (HP) PCI-based emulator offers seamless exchange of real-time data from the host to the target application. USB-based and High Performance (HP) USB-based emulators are easy, portable, non-intrusive, target-based debugging solutions.

The HP USB-based emulator also supports the Background Telemetry Channel (BTC), a non-intrusive method for exchanging data between the host and target application without affecting the target system's real-time extended support characteristics.



Green Hills® Software (GHS)

Along with Analog Devices, Green Hills Software has developed a multiyear product road map for hardware and software development tools, providing full support for the Blackfin Processor.

These include:

- MULTI® Integrated Development Environment (IDE)
- C, C++, and EC++ compilers
- Green Hills® Probe and Slingshot™ Hardware Debug Devices
- INTEGRITY® Real-Time Operating System
- *velOSity™* Microkernel

From simulation to deployment, GHS technology saves time throughout a project development life cycle with powerful features and an efficient design that eliminates having to learn different tools and user interfaces.

Blackfin Test Integration Toolkit for NI LabVIEW

National Instruments LabVIEW toolkit provides a high level method for easily building test systems and utilities for Blackfin Processor systems.

By integrating testing, engineers can iteratively verify their design throughout the development process.

Early use of the Test Integration Toolkit reduces overall development time and improves the quality of products that use the Blackfin Processor.

QuickStart Development Kit

The "entry level" QuickStart Development System allows designers to rapidly evaluate MicroConverter performance and functionality, and then begin a prototype development. It fully supports assembly level code development via a serial port debug path and provides designers with access to a demonstration project of the C-level development environment available in QuickStart-Plus.

Kit Contents: • Evaluation Board • Serial Download/Debug Cable • Sample Device(s) • International Power Supply • Software and Documentation

STATIC PROTECTION

Protection of static sensitive parts is a MUST in today's semiconductor market.
To ensure the quality that Digi-Key customers have come to expect, the Digi-Key static control program includes proper static safety protection in the following areas:

- *Receiving, Incoming Inspection, and QC*
- *Order Picking*
- *Final Inspection*
- *Packaging and Shipping*

Shielded metallized bags are used in order picking, and 100% recyclable paper packaging is used n packaging and shipping.

As our program is continuously updated with the latest static control technology, you can be eassured that Digi-Key's static sensitive parts are quality safe, *all the way to your door step!*

• Please Note: SO-x packages are the same as x-SOIC packages •
